Name: Manali Mange Class-MSC CS-part1

Roll no: 39

Business Intelligence and Big DataAnalytics

Mini Project

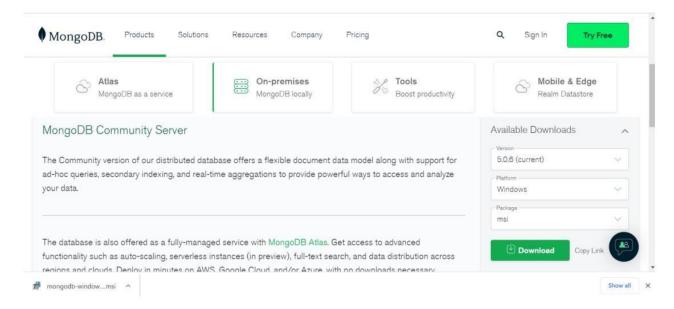

<u>Aim:</u> Executing CRUD operations in MongoDB shell.

Steps:

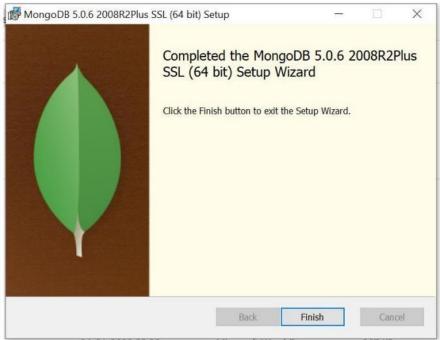

Steps to install MONGODB:

Step1: We need to download mongodb from https://www.mongodb.com/ website.

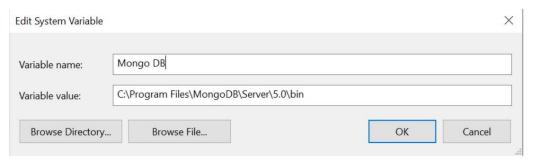

Step2: After successfully downloading mongodb we need to install it in our system.

Step3: After successfully installation of the mongodb we need to set path variable of the bin file of mongodb in environment in system .eg "C:\Program Files\MongoDB\Server\5.0\bin"

Step4: After setting path variable we can easily use mongo command in cmd and run mongodb shell.

Steps to execute commands:

1. Start The MongoDB shell.

2. Check for any existing databases.

3. So, we do not have our own existing database, hence we'll create a new one.

```
> use bibdb
switched to db bibdb
>
```

```
> show dbs
admin 0.000GB
config 0.000GB
local 0.000GB
```

4. We've created a database named bibdb here, but it is not displayed because it's empty, so we need to create a collection first inside this database. To insert a document into the collection json format is followed.

```
> db.student.insert({"studname":"ram", "address":"bandra", "class":"msc cs"})
WriteResult({ "nInserted" : 1 })
>
```

5. Here, we've created a collection in the bibd database named student and added a document of one employee. So now if we check the databases on the system we can see the database.

```
> show dbs admin 0.000GB
bibdb 0.000GB
config 0.000GB
local 0.000GB
```

6. Now, to check if the document is added in the collection we run:

```
> db.student.find()
{ "_id" : ObjectId("624486a3662a9f8946b9ecdc"), "studname" : "ram", "address" : "bandra", "class" : "msc cs" }
> _
```

7. So, the document we inserted earlier is shown here. If we want it in a more readable format we can use the pretty() function.

```
> db.student.find().pretty()
{
    "_id" : ObjectId("624486a3662a9f8946b9ecdc"),
    "studname" : "ram",
    "address" : "bandra",
    "class" : "msc cs"
}
```

8. We know how to create a database. Now let's see how to delete/drop a database. Here, I've already created another sample database "demodb" with a document in it.

9. To drop a single collection, you can do as follows:

```
> db.test.drop()
true
> _
```

If already deleted then it will show 'false' when we execute the same command:

```
show dbs
admin
       0.000GB
bibdb
       0.000GB
config
       0.000GB
demodb
       0.000GB
        0.000GB
 use demodb
switched to db demodb
 db.dropDatabase()
 "ok" : 1 }
 show dbs
      0.000GB
admin
bibdb
      0.000GB
config 0.000GB
local
       0.000GB
     db.test.drop()
    alse
```

- 10. The basic CRUD operations include Create, Read, Update & Delete.
- **11.** The Create commands are of two types "insertOne(data, options)" & "insertMany([data], options)".
- 12. The Read commands are of two types "find(filter, options)" & "findOne(filter, options)".
- **13.** The Update command are of three types "updateOne(filter, data, options)"; "updateMany(filter, data, options)" & "replaceOne(filter, data, options)".
- **14.** The Delete command are of two types "deleteOne(filter, options)" & "deleteMany(filter, options)".
- **15.** Executing the insertOne and insertMany commands:

16. Let us now check the database.

17. Here check the records/document we have updated in the collection employee

- **18.** Here, we've successfully executed the insertOne and insertMany commands and also Read the data in the Document.
- 19. Now let's try updating the class of Kapil to MSC CS in the document.

```
> db.student.updateOne({studname:'Kapil'},{$set:{class: "msc cs"}})
{ "acknowledged" : true, "matchedCount" : 1, "modifiedCount" : 1 }
```

20. Check if the value is updated:

```
> db.student.find().pretty()
{
        "_id" : ObjectId("6249690b05ccee021b594e6b"),
        "studname" : "Rahul",
        "address" : "borivali",
        "class" : "msc cs"
}
{
        "_id" : ObjectId("624969c905ccee021b594e6c"),
        "studname" : "Kapil",
        "address" : "chembur",
        "class" : "msc cs"
}
{
        "_id" : ObjectId("624969c905ccee021b594e6d"),
        "studname" : "Roshni",
        "address" : "Roshni",
        "address" : "kalyan",
        "class" : "msc cs"
}
```

21. Now lets try updateMany command

```
> db.student.updateMany({}, {$set:{mobileNo: "unknown"}})
{ "acknowledged" : true, "matchedCount" : 3, "modifiedCount" : 3 }
>
```

22. Keeping the first parameter blank means updating all the entries.

```
db.student.find().pretty()
{
    "_id" : ObjectId("6249690b05ccee021b594e6b"),
    "studname" : "Rahul",
    "address" : "borivali",
    "class" : "msc cs",
    "mobileNo" : "unknown"
}
{
    "_id" : ObjectId("624969c905ccee021b594e6c"),
    "studname" : "Kapil",
    "address" : "chembur",
    "class" : "msc cs",
    "mobileNo" : "unknown"
}
{
    "_id" : ObjectId("624969c905ccee021b594e6d"),
    "studname" : "Roshni",
    "address" : "kalyan",
    "class" : "msc cs",
    "mobileNo" : "unknown"
}
```

23. Now let's change the status of one employee.

```
> db.student.updateOne({studname: Rahul'},{$set:{mobileNo: 9876556790}})
{ "acknowledged" : true, "matchedCount" : 1, "modifiedCount" : 1 }
> db.student.find().pretty()
{
    "_id" : ObjectId("6249690b05ccee021b594e6b"),
    "studname" : "Rahul",
    "address" : "borivali",
    "class" : "msc cs",
    "mobileNo" : 9876556790
}
{
    "_id" : ObjectId("624969c905ccee021b594e6c"),
    "studname" : "Kapil",
    "address" : "chembur",
    "class" : "msc cs",
    "mobileNo" : "unknown"
}
{
    "_id" : ObjectId("624969c905ccee021b594e6d"),
    "studname" : "Roshni",
    "address" : "Roshni",
    "address" : "kalyan",
    "class" : "msc cs",
    "mobileNo" : "unknown"
}
```

24. Now using the Find command to find an entry with a particular tag.

- 25. Now we can work on some delete operations.
- **26.**So now let's delete an entry from an employee using deleteOne() where mobile number is provided.

```
b db.student.deleteMany({mobileNo:'unknown'})
{ "acknowledged" : true, "deletedCount" : 2 }
b db.student.find().pretty()
b db.student.find().pretty()
```

```
> db.student.deleteOne({studname:'Rahul'})
{ "acknowledged" : true, "deletedCount" : 1 }
> db.student.find().pretty()
{
        "_id" : ObjectId("624969c905ccee021b594e6c"),
        "studname" : "Kapil",
        "address" : "chembur",
        "class" : "msc cs",
        "mobileNo" : "unknown"
}
{
        "_id" : ObjectId("624969c905ccee021b594e6d"),
        "studname" : "Roshni",
        "address" : "kalyan",
        "class" : "msc cs",
        "mobileNo" : "unknown"
}
```

- 27. Now deleting users with deleteMany() operations where mobile number is unknown.
- 28. All records are deleted and hence we now have an empty collection.
- **29.** This is all with the CRUD operations in MongoDB.
